provides an essential first step in the analysis of information processing within and between neurons in a complete brain.

Introduction

In this age of genomics, proteomics, and metabolomics, neuroscience needs a similarly comprehensive, detailed map of brain circuits [1]. As recent advances in genetic tools for spatiotemporal control of neuronal activities have begun to unravel how genes and circuits orchestrate complex behaviors [2–4], an atlas of brain-wide wiring networks is all the more necessary for formulating hypotheses of information flow and guiding genetic manipulations [5–7]. An advantage of mapping single neurons as the basic elements is that they are well defined and easily demarcated [8, 9]. However, because of interindividual variation in synaptic arborization, a mesoscopic approach at the resolution of light microscopy is best suited for the first initial construction of brain-wide interregional connectivity maps in model systems such as the fruit fly and the mouse [1, 5, 7].

The adult *Drosophila* brain contains only ~100,000 neurons, whose projections cluster in internal neuropil structures while cell bodies are found in the outer brain surface. The *Drosophila* brain uses the canonical neurotransmitters, including acetylcholine, GABA, glutamate, dopamine, serotonin, and histamine [10–15], as well as octopamine and tyramine [16, 17]. Although clearly different in gross anatomy, both insect and

A Database of *Drosophila* Brain Neurons

Introduction Archive Browsing Search Analysis SnapShot Gallery Help

Welcome to FlyCircuit Database

FlyCircuit is a public database for online archiving, cell type inventory, browsing, searching, analysis and 3D visualization of individual neurons in the *Drosophila* brain. For more details, please read the associated manuscript – “Three-dimensional reconstruction of brain-wide wiring networks in *Drosophila* at single-cell resolution” (Current Biology 2010, doi:10.1016/j.cub.2010.11.056). Registration is only necessary for users who want to up/download data or activate 3D viewer. All images are copyright protected.

Java (Download) is needed for interactive 3D visualization. Your computer may already have one.

For the novice, we recommend to start from “Gallery” for application examples and “Help/Tutor” for step-by-step demonstrations.

Coarse Connectivity Map

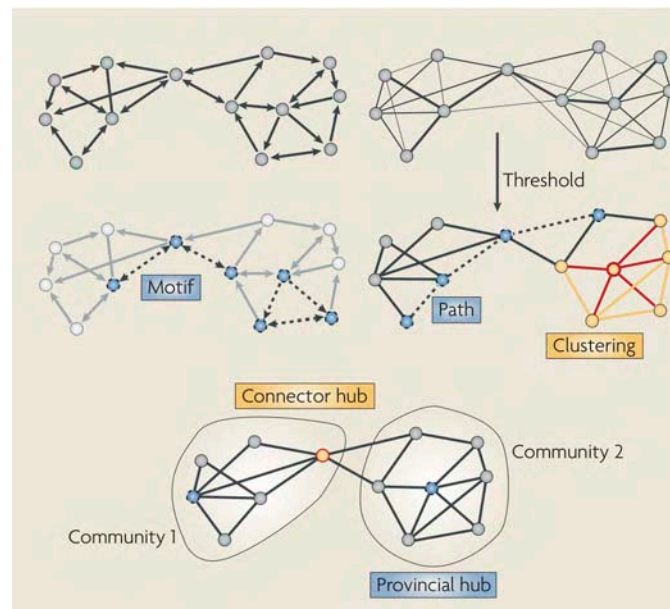

Have reassembled raw data

Example: 634 Olfactory Projection Neurons

15198 neurons ready for overlap-based reconstruction of fly neural circuits

What would you do?

Networks in Neuroscience 3

Neuron similarity

A graph matching problem – embedded in 3D space

Networks in Neuroscience 3

Neuron similarity

A graph matching problem – embedded in 3D space

Networks in Neuroscience 4

Analytic tools related to network analysis – compare bioinformatics

- Similarity measures for neurons
- Use to search databases (cf BLAST)
- Identify neuron families (cf PFAM)

Convert image to (3D) skeleton

NBlast

Histogram of scores1new3

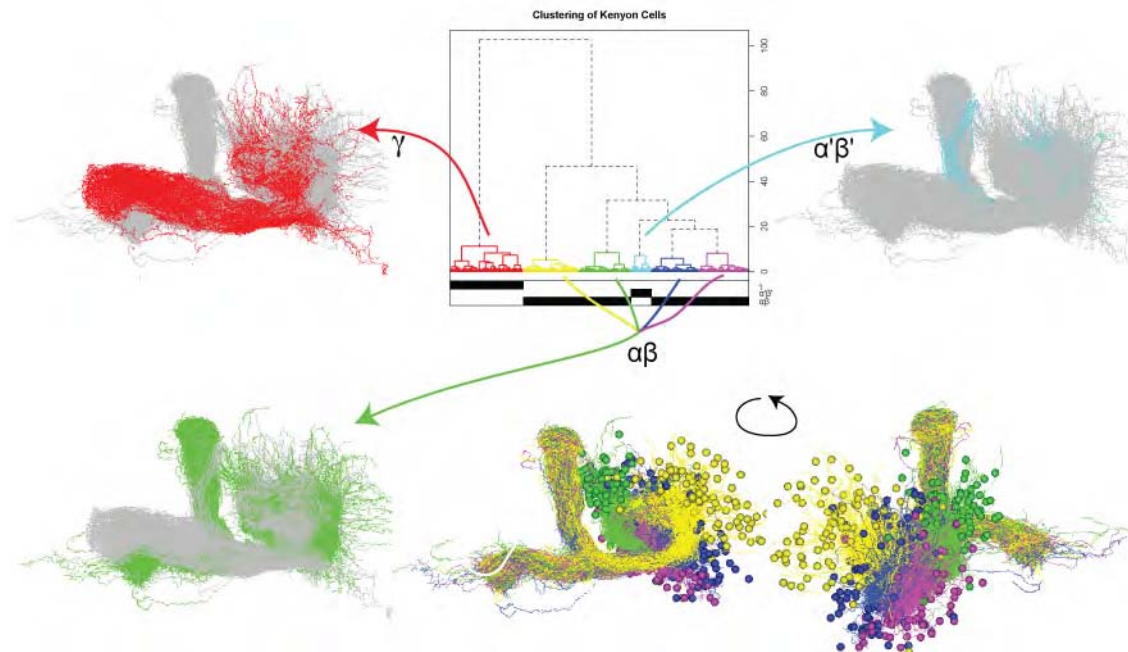

Histogram of scores1new3

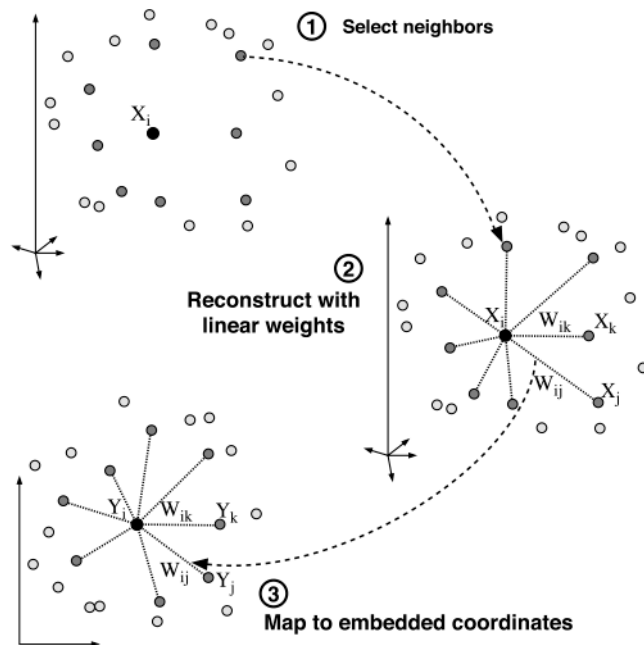

Clustering by Search Score

Example: 1500 Mushroom Body Neurons (required for olfactory memory)

Local Neighbourhood Methods

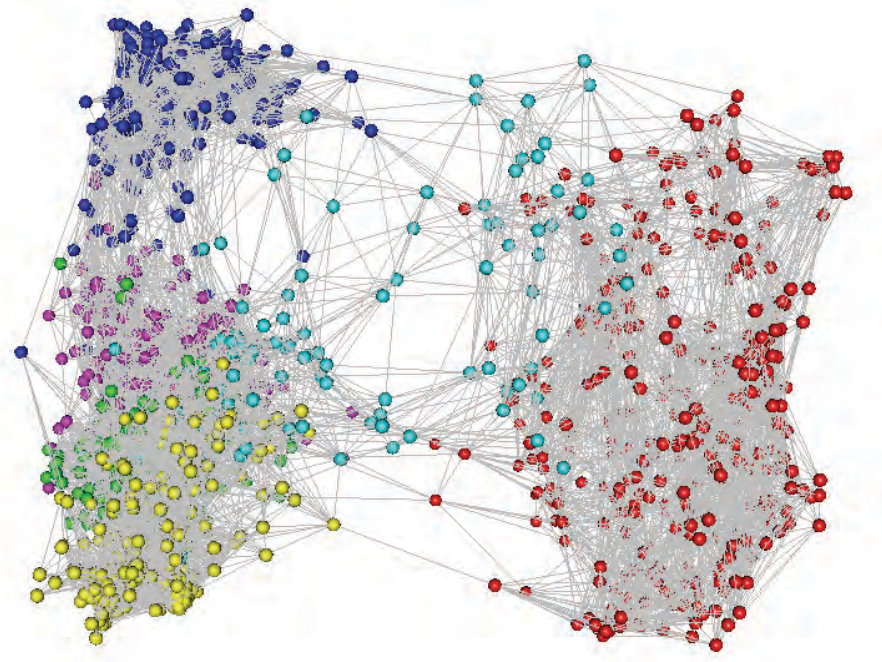

- Convert all x all distance matrix into local neighbourhood graph
- Can visualise structure in high-dimensional data
- Can improve clustering results and time/space constraints for large data

e.g. LLE, ISOMAP etc

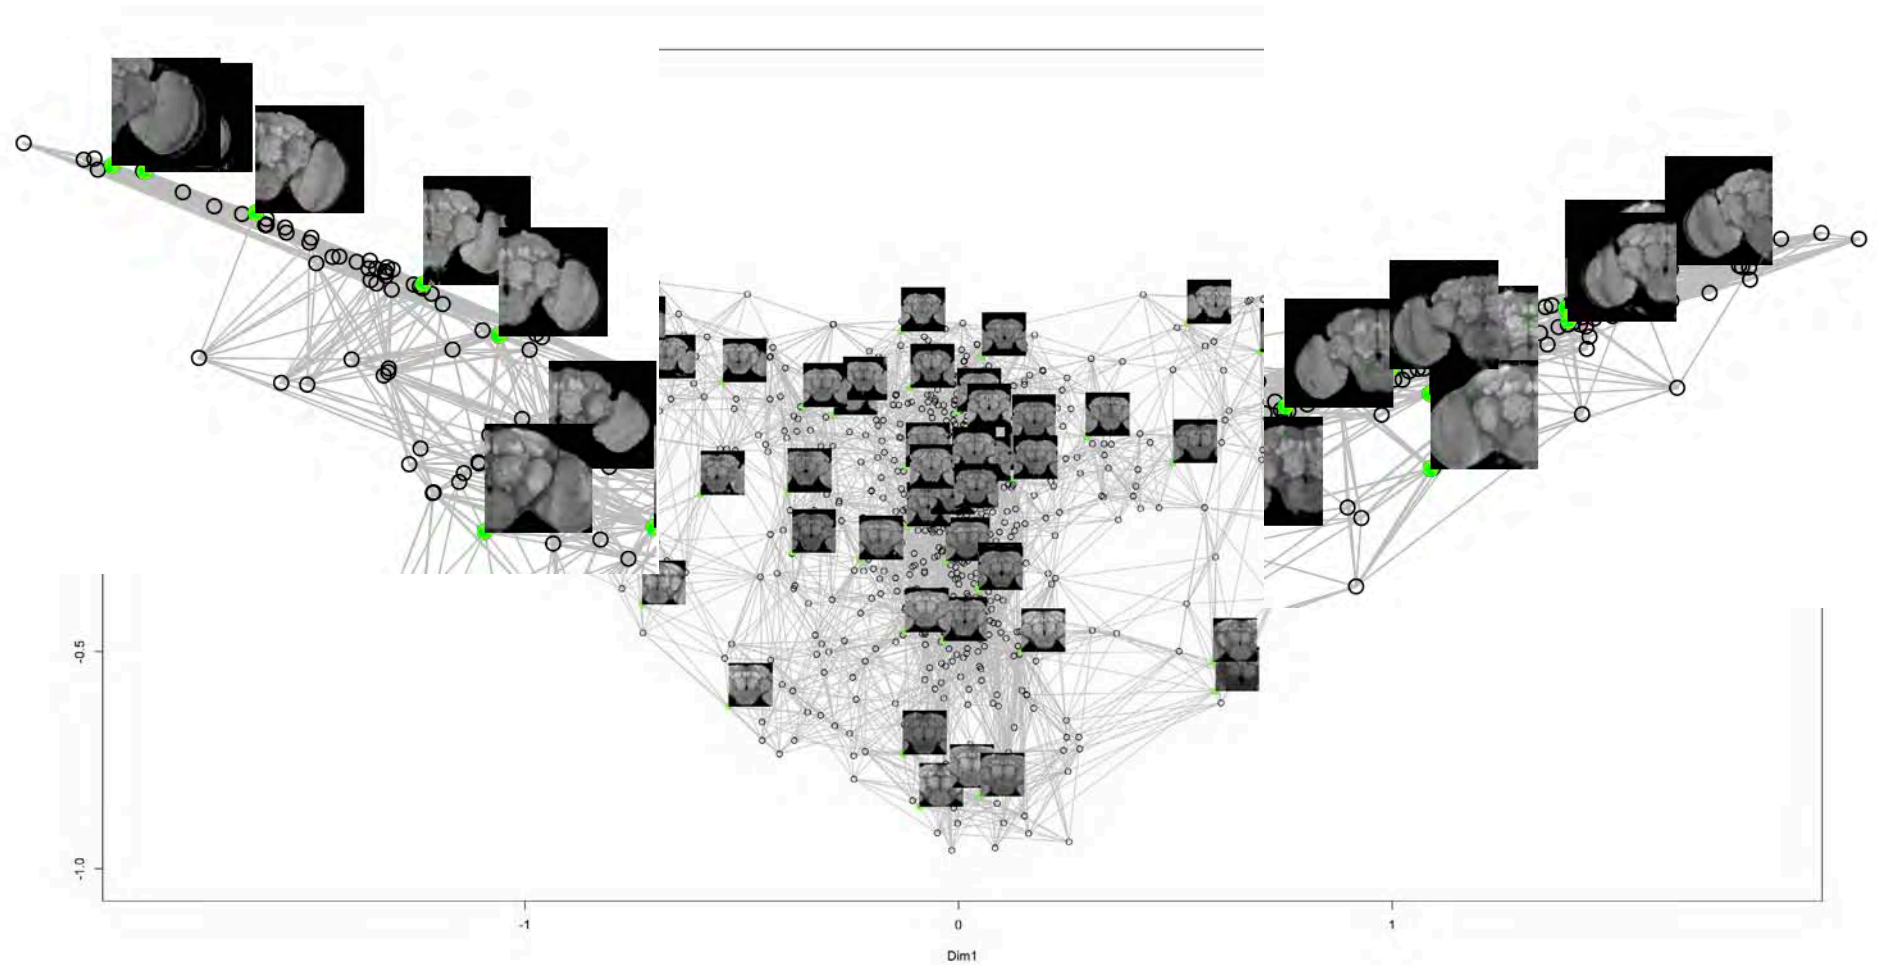

Clustering vs ISOMAP

Non-linear dimension reduction allows visualisation of individuals in context of whole data structure

ISOMAP embedding
of distance matrix

ISOMAP and Registration Pose Problem

Message Passing Clustering

aka Affinity Propagation

ITERATION 1 of 72

Message Passing Clustering

286 exemplars
(for 15198 neurons)

15 exemplars

Clusters for 15 exemplars
(total of 743 neurons)

Conclusions

- Neural Networks in the fly are highly stereotyped and can be mapped to single cell level
- Differences in network structure can explain some features of sexually dimorphic behaviour
- Neuron mapping data present interesting problems in analysis both of neural connectivity networks and to tame high dimensional neuronal structure data.
